

DTH-REC

Robit® Overburden Eccentric System

- Designed to offer maximum reliability in overburden drilling conditions
- Enables driving the casing in all downward vertical directions/formations
- Helps avoid collapsing holes and lost equipment
- A two-piece bit, consisting of a concentric pilot bit and a swing-out eccentric reamer
- Enlarges the hole's diameter driving the casing down into the hole
- Reamer can be retracted by applying reverse rotation
- Full system can be pulled out and used again
- Ideal for water well and geothermal drilling, micropiling, as well as dam and port projects
